

DynaLOCKR™ S4

DynaSEALR™ C11

People and property protection

In today's world there are unprecedented threats to peace and security. Risks to life and property from explosive devices and chemical/biological agents have increased dramatically. Airports, public spaces and logistics companies are vulnerable prime targets for terrorism and other hostile attacks. Letters and parcels containing explosives or toxic agents are intentionally used to threaten individuals, organisations, and governmental institutions. Direct attacks are a reality around the world.

Best in class explosion protection

Dynasafe products feature:

- Gastight and non-gastight containment
- Integrated systems
- Scenario-based tailored solutions

Dynasafe Protection Systems has implemented over 250 units / systems worldwide.

Technical Service

Dynasafe Protection Systems customers have access to an extensive network of partners and distributors, in more than 20 countries, with local sales and technical service support.

Examples of technical service:

- Upgrades
- Training
- Spare parts
- Service and repairs
- Testing and recertification

About Dynasafe

Dynasafe protects mankind from threats caused by explosives and hazardous materials. The company is the global market leader in the removal, management and disposal of Chemical, Biological, Radiological, Nuclear, explosive (CBRNe) materials both on and off shore.

Through its three business units, Area Clearance, Protection Systems and Demil Systems, Dynasafe is the only global company capable of addressing the entire ordnance disposal value chain.

Dynasafe has its headquarters in Stockholm, Sweden, and a strategic network of subsidiaries and sales partners for global reach. The company has around 400 permanent staff and, at any one time, a large number of additional contracted staff mainly involved in area clearance projects. Dynasafe operates in more than 70 countries with customers in both the public and private sectors.

Dynasafe's innovative products and extensive knowledge has made it possible to deliver:

- More than 1,000 unexploded ordnance clearance and demining projects worldwide, both on and off shore
- Over 250 containment chambers and integrated protection systems
- More than 25 chemical and conventional demilitarisation plants globally

Make the world a safer place

Make the world a safer place

Protection as an integrated solution

Dynasafe delivers the most comprehensive package of protection solutions available. Market-leading products include the ultimate standard of gas-tight chambers with a variety of sizes, protection levels, implementations and options. Dynasafe systems are integrated into seaport and airport security systems and public spaces to meet the requirement of efficient safety procedures.

The market-leading chamber used for public protection, at airports and in other public places, is the DynaSEALR™ E-chamber. It has a large opening and a rotating door for easy loading and provides gas-tight containment for explosives and toxic substances such as chemical and biological agents.

Over time as larger projects develop there is often a need for special requirements; Dynasafe is able to integrate sub-systems and technologies into systems combining safe removal, containment and transport of objects that are explosive or suspected of being explosive.

Dynasafe has extensive experience in the design and operation of explosion protection and related security systems. By discussing the client's needs at an early stage Dynasafe is able to provide the optimum solution for maximum protection, to an existing, adapted or entirely new solution.

Integrated baggage handling protection solution

Airport Security

Airports are vulnerable prime targets for terrorism and other hostile attacks. Threats are not only limited to explosive devices; the safety risks from misused toxic or bio-toxic material have also become apparent. Dynasafe Protection Systems is able to provide the right protection equipment for secure operations of the airport at all times.

Dynasafe mobile explosion containment vessels enable rapid reaction to an identified suspect item in different areas of the airport. The vessels provide immediate protection, and minimise disruptive evacuations and costly delays / cancellations in flight operations. The safety is increased not only for the airport visitors and personnel, but also for the Explosive Ordnance Disposal (EOD) technicians responsible for removal.

A suspicious object will be quickly secured and removed from public areas, with a towable vessel which is able to navigate narrow spaces. Suspect hand-luggage is quickly contained without manipulation, with a semi-automatic vessel; compatible with most baggage handling and X-ray systems available. Checked luggage is secured with a gas-tight containment system, featuring large containment and luggage size capacity.

Public Security

Dynasafe provides reliable protection equipment for all kinds of public spaces, incorporating systems which are easy to handle, load and maintain. Dynasafe products are used not only to react to, but also to prepare for, possible worst-case scenarios including bomb threats and terror attacks. This level of security is available to any venue attracting large numbers of people, such as train stations, exhibitions and during major sport, cultural, or political events. Also, Dynasafe Protection Systems will ensure overall efficiency and safety when integrated into logistic and baggage handling systems.

The adaptability and flexibility of the protection chambers makes them suitable for diverse applications by private, semi-private, and governmental organisations. The chambers are also used extensively within the logistics, transportation and cruise sector, along with the postal and parcel service.

A suspicious object in a public area is quickly secured with a Dynasafe containment vessel, while waiting for a professional EOD team to arrive. Suspect letters or parcels will be immediately contained by having the small, user-friendly Dynasafe chamber at hand. Explosion-resistant litter bins are also available, these will prevent injuries and minimise damage to people and property from a terror attack.
